STÄRKE AMBIANCE SPECIFIERS GUIDE

FOREWORD

Welcome to the latest specifiers design guide for the Ambiance Inline Window System!

At STÄRKE, we are passionate about making it easy; it's just the way we do things. We wish to empower architects and specifiers with knowledge to allow them to explore their creativity, integrating high-performance window systems into their designs.

That is the driving force behind this new guide document. It contains a comprehensive overview of the detail in the STÄRKE Ambiance Inline Window System - everything from technical datasheets to design advice, certificates and reports.

We look forward to working with you to create warmer, drier and healthier homes throughout this beautiful country we live in.

For assistance, clarification, support or further details contact us directly at technical@starke.co.nz or phone us on 09 279 8617.

Yours sincerely,

Team STÄRKE

THE STÄRKE DIFFERENCE

STÄRKE Ambiance uPVC

UPVC FRAMES Strong steel-reinforced uPVC frames to battle against heat transfer and outside noise LOW-E GLASS Insulating glass units to control heat loss and solar gain with maximum clarity **CO-EXTRUDED GASKETS** Gaskets are co-extruded with the frame profile meaning no path for air, water or sound leakage **INTERNALLY BEADED** WELDED CORNERS Protection from invaders and easy glazing from the inside Factory welded corners preventing movement and sealing against air, water and **DUAL SEALING** sound leakage

Two sealing points which are coextruded with the frame to prevent any air, water or sound leakage

SECURE HARDWARE

Premium multi-point locking hardware makes it burglar resistant

TILT & TURN WINDOW

ADVANTAGES

- Easily clean the outside pane from inside with the turn functionality
- Increased security with multiple locking points
- Better thermal performance and air-tightness than an awning or casement
- Larger windows available than awning
- Secure ventilation while you are out
- Highest rated sound insulation
- Lower maintenance and longer life expectancy than an awning, because the weight is not hanging on the fastenings

DESIGN ADVICE

- Best option for high performance builds because of the high air-tightness
- Ideal for second-storey windows, so the outside can be cleaned. Keep sill height above 1000mm so there is no fall risk.
- Tilt-only is ideal for large picture windows where ventilation is required
- Tilt-only is the most cost effective option
- Tilt-before-turn can be can be specified with a key to meet safety from falling NZBC F4
- Lowest maintenance option
- Open-in configuration requires wall-mounted curtains
- No raked opening sashes the operable window must be square

TECHNICAL

- Dual function with Tilt and Turn
- Added security with multiple locking points.

Cross Section

AWNING WINDOW

ADVANTAGES

- Traditional opening style in New Zealand
- Inferior performance to Tilt & Turn
- Enables secure ventilation with multi-point interior locking
- Can be locked in ventilating position
- More secure than an aluminium window
- Best used on smaller units
- Can pose a risk when opening onto passageways or decks

DESIGN ADVICE

- Best used for refurbishments or smaller windows
- Commonly used in more traditional builds
- Best used on builds where low cost is a primary factor
- No raked opening sashes the operable window must be square

TECHNICAL

- Secure locked ventilation
- Added security with multiple locking points.

Cross Section

HINGED DOOR

ADVANTAGES

- Traditional opening style, can be used in a "French door" style
- Open in and open out configurations
- High air-tightness with multi-point locking
- Very high security
- Wide opening provides 100% opening space
- Low maintenance with reliable hinges and locking mechanisms
- Recommend for Passive House designs

DESIGN ADVICE

- Recommended for service doors or laundry doors
- Low-height sill option
- High air-tightness makes for the best option for Passive House.
- Can be paired with side-lights for secure ventilation
- Multi-point locking available
- Open in is recommended as a Tilt & Turn
- Parliament hinge option for brick veneer cladding

TECHNICAL

- Added security with multiple locking points
- Multiple key and snib configurations

ENTRY DOOR

ADVANTAGES

- Glazing, frosted, full panel, or panel with transom/ mullion options
- 40mm composite panel can be glazed into the sash
- 50mm composite/aluminium/timber panel can be mounted directly to frame
- Large range of design options and colours to suit every taste available.

DESIGN ADVICE

- Sheltered installation preferred away from full sun exposure and driving rain
- A large range of configurations available
- Equivalent R-values of standard doors achieved
- Peep holes can be incorporated
- Side-lights are a common design feature
- 40mm glazed-in sash panels have full multi-locking and air-tightness, but are limited to E-LOK electronic locks
- 50mm hinged-in panels have single-point locking, worse air-tightness, all lock options but come at an extra cost.
- Parliament hinge option for brick veneer cladding

LIFTSLIDE DOOR

ADVANTAGES

- Fully flush sill, barrier free entry possible
- Air-tightness level suitable for Passive House
- Opened and closed without effort even with extra large door panel sizes
- Suitable for double or triple glazing

DESIGN ADVICE

- Most luxurious door in the STÄRKE Ambiance Range
- Recommended for projects with high air-tightness requirements such as Passive House
- Sliding and bi-parting configurations only
- Rebate the sill for perfectly flush entry

TECHNICAL

SMARTSLIDE DOOR

ADVANTAGES

- SmartSlide technology allows high air-tightness
- Large panel openings available
- Best-selling sliding door system
- Smart sliding hardware enables silent free-gliding movement
- Sliding or Bi-parting configurations available
- Hardware allows secure locked venting function for passive airflow

DESIGN ADVICE

- Most cost-effective high air-tightness door, suitable for Passive House.
- Recommend no more than two doors for Passive House
- Large panel sizes available
- Suitable for SED wind zones
- Sliding panel to be at least 100mm wider than the height

VARIOSLIDE

ADVANTAGES

- Stackers and Sliders available
- Great for large openings and indoor-outdoor flow
- Cost-effective entry-level door with high thermal performance
- Most similar to a traditional aluminium sliding door

DESIGN ADVICE

- Stacking or sliding doors available, including 4- or 6-panel bi-parting doors
- No awnings available in fixed pane
- Can be rebated for flush entry
- Recommended 140mm framing for all stackers
- Recommended 90mm framing for all sliders

INVISIFOLD

ADVANTAGES

- Each panel operates individually reducing the load on the other panels
- All panels stack in one direction
- First panel is hinged opening and can be used as a single door
- Can open a few panels only don't have to open all at once
- Easy operation

DESIGN ADVICE

- Open out operation
- Average panel size of 800mm 900mm
- The wind zone will affect the panel width
- Cross sections are similar to Open Out Hinged Door
- Consider Smartslide or LiftSlide if higher air-tightness is required

TECHNICAL

CUSTOM UNITS

ADVANTAGES

- Custom shapes and sizes available
- Coupled units available with all systems
- Allows greater flexibility to design special items to compliment your design

DESIGN ADVICE

- Raking units a minimum angle of 30 degrees
- Maximum of 5 corners per window for raking units
- Take into account the profile width when coupling units
- Wind beams or lintels provide a good solution to overcome deflection for larger units

TECHNICAL

INTERNAL FINISHING OPTIONS INSTALLATION WITH REVEAL

Installation with a timber liner is the traditional window installation method in New Zealand. This method includes a pre-primed 18mm timber reveal, fitted to the window in the factory.

TWO SECURE FIXING POINTS

Historically, this timber liner is only stapled to the aluminium frame, however with our Ambiance uPVC system, the liner is fixed through the frame with a nail at regular intervals, in addition to staples. Also, steel fixing tabs - which clip into the frame - are fitted and fixed with screws into the back of the timber liner. This provides a very secure fixing of the liner to the frame, as it should be.

AIR-TIGHT TAPE

Additionally, we apply a premium air-tight tape around the entire perimeter of the frame, overlapping the window frame and timber liner. This means there is no air leakage at all between the liner and frame - a high-performance solution directly from the factory.

After the window is fixed into the building wall framing, PEF rod is inserted in the cavity then sealed in place with a unbroken bead of wet seal product. This completes the internal installation of the Ambiance window and provides a high-performance, air-tight solution superior to other mainstream products available in New Zealand currently.

This allows for:

- Grooved liners for plasterboard return
- Flat liners for finishing with an architrave

Grooved Liners

Architrave

INSTALLATION WITH FIXING TAB

Installation with fixing tabs is a more flexible option for the internal finishing options available. No timber reveals are supplied, instead steel fixing tabs are clipped into the frame in the factory ready for installation. The fixing tabs can be trimmed onsite to the correct length, depending of the wall framing depth.

FLEXIBLE INTERNAL FINISHING OPTIONS

No timber reveals are supplied from the factory with this method. This allows you to design and specify the best option to suit your clients requirements. This includes allowance for a plasterboard return option or tiles directly up to the window frame. Reveals can also be used with this fixing method. When installed, the internal finishing should cover the tape overlapping the frame at least and do so without puncturing the tape. It is also possible to bring the internal finishing in to cover the whole frame depth, making for a minimalist frame appearance.

AIR TIGHT TAPE

Air-tightness tape is supplied in rolls with each window delivery. This is to be installed to cover the window frame by 10mm and the rest overlapping onto the building framing. It is to be fitted after the window is installed and ensures a completely air-tight dry installation. It is important this tape is fitted after the window is fixed in place and completely covers the entire steel fixing tab.

This allows for more flexibility with the internal finishing, including:

- ▶ Plasterboard/tile return
- Grooved liners for plasterboard return
- Flat liners for finishing with an architrave

PLANTED LINERS

This allows for the same finishing options as installation with reveal method

Grooved Liners

Architrave

EXTERNAL FINISHING OPTIONS RECESSED FLASHING KIT

Recessing your windows into the building framing has long been proven to get the most out of the thermal performance of the frames - this is just basic building science. The key point is connecting the wall insulation with the window insulation: a recessed window install.

Ambiance uPVC windows and doors have a high thermal performance value for joinery that is available in the mainstream building supplies market in New Zealand and with volume supply capability.

Included with the Ambiance uPVC Inline Window System is a 4-sided flashing system, covering the perimeter of the window externally on the head, sill and jambs. This cleanly covers the external cavity and cladding, in a simple way making installation easy.

This kit is designed to cover the cavity and cladding to protect the cavity from rain, and to provide an aesthetic, functional and easy recessed installation.

- Available in different sizes for different cavity and cladding applications
- 4-sided (head, jamb & sill) flashing kit
- Proprietary design extruded aluminium and powder coated to match the uPVC joinery colour
- Built-in leg which slots into groove in the uPVC profile

FLASHING KIT SIZES

FLASHING KIT SIZES	RECOMMENDED CLADDING DIMs	SOME TYPICAL APPLICATIONS
35mm	25 to 29mm	19 Cavity & 9mm Sheet -OR- 19 Cavity & Folded Metal Cladding
45mm	35 to 39mm	19 Cavity & 19mm Sheet -OR- 19 Cavity & Rusticated Weatherboard
60mm	50 to 54mm	19 Cavity & Bevel-Back Weatherboard -OR- 45 Cavity & 9mm Sheet
65mm	55 to 59mm	50 Cavity & 70 Brick -OR- 45 Cavity & Folded Metal Cladding
70mm	60 to 69mm	45 Cavity & 19mm Sheet -OR- 45 Cavity & Rusticated Weatherboard
80mm	70 to 74mm	19 Cavity & Bevel-Back Weatherboard with Facings
85mm	75 to 79mm	45 Cavity & Bevel-Back Weatherboard

CLIP IN FLANGE

A 30mm or 50mm clip in uPVC flange is also available. Typical uses for this are:

- On the sill only for doors and windows where the window frame is on the floor
- Renovations and retro-fit projects
- Standard E2/AS1 install (not recommended by STÄRKE as this compromises the thermal performance of the frame)

HARDWARE ACCESSORIES

RESTRICTOR STAYS

- Restricts the window opening to 100mm
- Stainless Steel
- Fully concealed design

HOLD BACKS

- Wall and floor mounted options
- Coloured to match joinery or any powder coat colour
- Short or long throw options
- Easy to install

DOOR VIEWER

- Wide viewing angle
- One-way viewing for security

WINDOW ACTUATORSAvailable in black and white

Compatible with awning and Tilt-only windows

CONCEALED WINDOW ACTUATORS

- Includes multi-point locking control
- Fully concealed installation
- Controllable by a physical switch or automation system

Controllable by a physical switch or automation system

• Compatible with Tilt & Turn and Tilt-only windows

COLONIAL / GEORGIAN BARS

- Colour matched uPVC profile
- Includes rubber gaskets
- Strong application for long life
- Applied on the external faces of the glass

LOW-E GLAZING LIGHTBRIDGE 1.1[™]

LightBridge 1.1[™] is a low-e coating supplied by Viridian Glass for double and triple glazed units.

This glass is designed to allow heat from the sun to enter your home for warmth and retain it inside.

APPLICATIONS

- Residential homes
- Walk-ups and townhouses
- Residential apartments

SPACER

All LightBridge 1.1 glass units contain a thermally improved spacer bar and argon gas.

DESIGN CONSIDERATIONS

- Maximum size: 4500mm x 2700mm (varies with glass type and thickness)
- Internal gem bars are not compatible with low-e glass, consider external colonial bars if required
- In warmer areas, consider specifying LightBridge to the south and east elevations to maximise the heat from the sun.
- Available in clear, grey tint and EtchLite obscure options

PERFORMATECH[™]

PerformaTech is a low-e coating supplied by Viridian Glass for double and triple glazed units.

This glass is designed to restrict heat from the sun entering your home to assist with overheating, and retain heat generated inside.

APPLICATIONS

- Residential homes
- Walk-ups and townhouses
- Residential apartments
- Commercial

SPACER

All PerformaTech glass units contain a thermally improved spacer bar and argon gas.

DESIGN CONSIDERATIONS

- Maximum size: from 3300mm x 2140mm to 4500mm x 2700mm (varies with glass type and thickness)
- Internal gem bars are not compatible with low-e glass, consider external colonial bars if required
- In warmer areas, consider specifying PerformaTech to the north and west elevations to assist with preventing overheating
- This glass allows 35% of the suns heat through, so extra heating may be required in winter if PerformaTech is used
- External solar shading is the most effective way to combat overheating in summer
- Available in clear, grey tint and EtchLite obscure options

GLAZING OPTIONS UV PROTECTION

Tdw-ISO is the measure of damaging light wavelengths that can pass through the glass. While all wavelengths on the spectrum contribute to fading, some do more damage than others, such as UV light. Twd-ISO is a weighted measure to account for this and provide an accurate result.

Tdw-ISO is measured relative to a standard clear/clear DGU which has a Twd-ISO of 0.73. So, a laminated DGU with a Twd-ISO of 0.57 is about 57% better at protecting interior furnishings than a clear/clear DGU.

Laminated glass is the best option to consider to protect interior furnishings from fading.

ACOUSTIC

STC Rating (Sound Transmission Class) is the measure of the glass ability to reduce sound penetrating through it. The higher the rating, the better the glass is at preventing sound passing through it. The STC Rating ranges from 25 (no soundproofing) to 65 (completely soundproof).

A single glazed window has an STC of around 25, a standard double glazed window will often be around 33-35.

Laminated glass is the best option to increase the STC of windows and doors.

TINT / CLARITY

Visible Light Transmission (VLT) is a measure, as a percentage, of how much light passes through the glass.

With no glass, there will be a VLT of 100%, therefore an IGU with a VLT of 80% will let through 80% of the outside light.

Grey tint is a popular option to include for aesthetics, however it significantly reduces the amount of light able to enter a room. Tinted glass, contrary to some thoughts, doesn't do much to reduce fading - for this, consider Low-E or laminated options.

Tinting the glass also reduces the solar heat gain (g value), however, this can be an artificial benefit as the glass itself heats up and then radiates this heat into the room.

g	Heat gain	Twd-ISO	Fading

NOTES:

- LightBridge is applied to surface 3 on DGUs and 3 & 5 on TGUs
- PerformaTech is applied to surface 2 on DGUs and 2 & 4 on TGUs
- All glass panes in the IGU are the same thickness, except:
 - Laminate pane is 6.38mm
 - Centre pane in TGU is 4mm
- DGU total filling thickness is 24mm
- TGU total filling thickness is 40-41mm
- Spacer thickness is the total filling thickness minus the sum of all pane thicknesses
- Rw value is an average for a sample house lot with Ambiance uPVC frames and Low-E
- Spacer includes a thermally improved spacer bar and argon gas
 - VLT Visual clarity
 - **Rw** Average of the entire window with Ambiance uPVC frames

STÄRKE SERVICES

STÄRKE is one of the only end-to-end joinery suppliers in New Zealand, which makes us uniquely placed to streamline your workflow, and provide high volume, high performance joinery on time and to specification.

We work with architects, engineers and specifiers from initial consultation, right through to pricing building partners, confirming specifications, and then fabrication, delivery and installation.

ARCHITECTURAL SUPPORT & DETAILING

- Design consultation
- Shop Drawings & PS1
- Samples boxes nationwide

TESTING & COMPLIANCE

- > H1 compliance documentation via schedule, calculation or modelling method
- Support with council documentation & RFI
- Onsite or offsite joinery testing
- Blower door testing (coming soon)

EDUCATION & TRAINING

- Preliminary, budget and final pricing
- Architects Education, CPD accredited presentations
- Installation & after sales

TECHNICAL SUMMARIES

The following R Value Performance Guide (as per NZBC H1/AS1 Table E.1.1.1) shows just how great the performance gap is between thermally broken aluminium and uPVC window frames – irrespective of the glazing specification.

WINDOW R-VALUE PERFORMANCE GUIDE As per NZBC H1/AS1 Table 1.1.1

COPYRIGHT STARKE GROUP NOV 2023

DURABILITY

New Zealand's diverse climate, ranging from the sunny North to the icy deep South, presents a huge durability challenge for most construction materials. When it comes to window frames, surviving in the face of varying temperatures, high humidity, and exposure to intense sunlight is paramount. In this context, uPVC (unplasticised polyvinyl chloride) emerges as a stand out material, offering exceptional performance for New Zealand homes.

WARRANTY

STÄRKE include a 10-year warranty period which serves as a commercial commitment to the durability of our uPVC window frames. Manufacturers typically offer this warranty to assure customers of the product's quality and performance, providing coverage for any unforeseen issues during the initial period of use. It should be noted that different manufacturers have varying levels of faith in their own product, and sometimes this is represented in shorter warranty times.

EXPECTED LIFESPAN

The expected life-span of 40-50 years is the anticipated duration that uPVC windows are designed to endure without significant deterioration. This considers factors such as material strength, resistance to weathering, and overall structural integrity over a prolonged period. It should be noted that this is a subjective topic and the expected lifespan is a design consideration, but not accounted for in the building code.

UV RESISTANCE CERTIFICATE

SCRATCH RESISTANCE

STÄRKE Ambiance uPVC frames are durable and resilient, however, it is possible to scratch them with a sharp object or similar. The frames are supplied to site with a tape applied for protection. If the frames do become scratched, the uPVC profile is coloured through the entire profile helping small scratches to blend in easily. However for more visible defects there are three alternative methods listed below, in order of difficulty and cost.

REPAIR METHODS

MARKER PEN

This option is the simplest and fastest way to cover small scratches and scuffs on uPVC profiles. It involves using a marker pen specifically designed for touch-ups on uPVC profiles. These contain a special ink, and are available in many different colours.

WAX

Wax is a hard and durable filler. This option is typically used for high use areas and deep scratches. It is melted into place to ensure a secure bond with the uPVC profile, and it is available in a large range of colours. The finish matches the uPVC profile to ensure it blends in with the profile.

RE-FOIL

Re-foiling is the solution if the other options are not suitable. This involves removing the existing foil over the entire length of the affected profile and applying a new foil to cover the profile. It is applied with heat to bond to the uPVC profile and is available in multiple colours and finishes to match the existing profiles.

Confirmation of the recycled content of window profiles of the aluplast IDEAL 7000 system

Dear Mr. Bender

Your company aluplast applied to our quality association for confirmation of the recyclable content of the following profiles of the IDEAL 7000 system. For this purpose, we received the dimensioned cross-sectional drawings of these profiles from you, on which the mass proportions of virgin material and recyclable material (rPVC) are specified. These mass proportions result from the design of the extrusion tool and are therefore tool-related. Fluctuations are only possible to a small extent. The following recyclable proportions result from the documents mentioned:

Profile number Article number	Designation	Mass of fresh material (g/m)	Mass rPVC (g/m)	Mass fraction rPVC (%)
170 002/302/402 0000013 170 002 0000013	Frame	538	919	63,1
170 020/320/420 0000013 170 020 0000013	Sash	701	822	54,0
TOTAL Window	Frame + Sash	1239	1741	58,4

Summary:

- A window consisting of the above-mentioned profiles from the aluplast IDEAL 7000 system has a mass proportion of recycled material of >55%.
- According to the statement of our quality association dated August 6, 2019 on the use of recycled materials in window profiles, retention samples with recognizable profile markings should be kept when producing windows for specially funded building projects. This means that, upon request (e.g. from the funding body), an analysis of the recycled content of the profiles used for a project can be carried out subsequently.

Best regards Quality Association for Plastic Window Profile Systems e.V. I.A. Bernhard Elias

PRODUCT TECHNICAL STATEMENT

KEY INFORMATION

1.0

Summary of Description of Building Product

Stärke Ambiance Inline Window system uPVC windows and doors are a standard New Zealand residential joinery range which can be double or triple glazed. They include:

- Fixed, Awning and Casement Open Out Windows
- Smartslide Sliding Doors

Liftslide Sliding Doors

Tilt & Turn Open-In Windows

VarioSlide Sliding & Stacking Doors

Inward and outward opening French Doors

Continuation of intended use can be found in item **9. Supporting information about Intended use of Building Product or Method**.

Matters that should be taken into account in the use or application of the building product can be found in **6. Conditions and Limitations of Use**.

2.0

Summary of Intended Use of Building Product

Stärke Ambiance Inline Window system uPVC windows and doors are for use as part of the building envelope in residential buildings. They contribute to natural daylight and ventilation and are suitable for use in building envelopes enclosing spaces where the temperature and/or humidity are modified.

Continuation of intended use can be found in item **8. Supporting information about intended use of Building Product**.

3.0

Building Code Provisions

The clauses of the New Zealand Building Code that are relevant to the intended use and with which the building product complies or contributes to (where used as part of a system)

- **B1 Structure:** B1.3.1; B1.3.2; B1.3.3 (a, b, h); B1.3.4
- **B2 Durability:** B2.3.1(b); B2.3.1(c) (For Hardware)
- **E2 External Moisture:** E2.3.2; E2.3.7
- E3 Internal Moisture: E3.3.1 (contributes to)
- **F2 Hazardous Building Materials:** F2.3.1, F2.3.3
- ▶ F4 Safety from Falling: F4.3.1
- G4 Ventilation: G4.3.1; G4.3.3 (contributes to)
- G7 Natural light: G7.3.1 (contributes to);
 G7.3.2 (contributes to)
- H1 Energy Efficiency: H1.3.1; H1.3.2E (contributes to)

If designed, used installed & maintained in accordance with the scope of this Technical Statement, the abovementioned product will meet the above-mentioned provisions of the NZBC. How the building method or product complies or contributes can be found in item **12. Basis for Certification**. Any qualification on the extent of that compliance can be found in item **6. Conditions and limitations of use**.

4.0

Conditions and Limitations of Use

Stärke Ambiance Inline Window system Suite uPVC Windows and Doors must be installed in accordance with the WANZ guide to Window Installation, and NZBC E2/AS1 or as according to Starke specific installation detailing.

Product must be maintained in accordance with the Stärke Maintenance and Care Guide.

All products detailed below are suitable for use in the EXTRA HIGH wind zones (as defined in NZS3604)

- Stärke Ambiance Inline Window system Fixed window up to 2100mm high x 3210mm wide
- Stärke Ambiance Inline Window system Fixed window up to 1400mm high x 1600mm wide
- Stärke Ambiance Inline Window system Hinged Door open out up to 2100mm high x 1150mm wide
- Stärke Ambiance Inline Window system Hinged Door open in up to 2100mm high x 1400mm wide
- Stärke Ambiance Inline Window system Hinged French Door open out up to 2100mm high x 2230mm wide
- Smartslide Sliding Doors up to 2.64m high x 5.8m wide
- Liftslide Sliding Doors up to 2.64m high x 8m wide

All products detailed below are suitable for use in the VERY HIGH wind zones (as defined in NZS3604)

▶ VarioSlide Sliding & Stacking Doors up to 2400mm high x 5800mm wide

The following attributes shall be determined specifically:

- ▶ Vision barriers must be specified when required for compliance with NZBC F2.3.2
- ▶ Safety glazing must be specified when required for compliance with NZBC F2.3.3
- Suitable restrictor stays must be specified when required for compliance with NZBC F4.3.1

NOTE: Together, items 3,4,5 and 6 define the scope of use.

5.0

Health and Safety Information

The compliance with any manufacturer's installation instructions, OH&S statements, MSDS's and other Health and Safety declarations will provide the necessary Health and Safety Information pertaining to the product.

Supporting Information About Description

The following models of windows and doors are covered by this certificate:

- Stärke Ambiance Inline Window system Fixed window up to 2100mm high x 3210mm wide
- Stärke Ambiance Inline Window system Awning window up to 1400mm high x 1600mm wide
- Stärke Ambiance Inline Window system Hinged Door open out up to 2100mm high x 1150mm wide
- Stärke Ambiance Inline Window system Hinged Door open in up to 2100mm high x 1400mm wide
- Stärke Ambiance Inline Window system Hinged French Door open out up to 2100mm high x 2230mm wide
- VarioSlide Sliding & Stacking Doors up to 2400mm high x 7000mm wide
- Smartslide Sliding Doors up to 2.64m high x 5.8m wide
- Liftslide Sliding Doors up to 2.64m high x 8m wide

8.0

Supporting Information About Intended Use

Stärke Ambiance Inline Window system Suite Windows and Door assemblies are for use in private houses, office blocks, and public and commercial buildings. Product must be installed as per NZBC E2/AS1, or Starke specific installation details and maintained in accordance with the Stärke Maintenance and Care Guide.

9.0

Supporting Information About Conditions and Limitations of Use

Stärke Ambiance Inline Window system Window and Door assemblies must be fabricated by Stärke Group Limited, 4 Wilco Place Wiri (www.starke.co.nz).

All conditions and limitations of use are stated above in item 6. Conditions and Limitations of use.

10.0

Basis for Compliance

- B1 Structure: by testing and compliance with verification method B1/VM1 and referenced standard NZS4211: 2008
- **B2 Durability:** By analysis and comparison with Verification Method B2/VM1
- E2 External Moisture: By testing and comparison with Acceptable Solution E2/AS1 and referenced standard NZS4211: 2008
- E3 Internal Moisture: By analysis and comparison with Acceptable Solutions E3/AS1, G4/AS1 and H1/AS1

- F2 Hazardous Building Materials: By comparison with the provisions of Acceptable Solution F2/AS1
- ▶ F4 Safety From Falling: By comparison with the provisions of Acceptable Solution F4/AS1
- ▶ G4 Ventilation: By comparison with the provisions of Acceptable Solution G4/AS1
- G7 Natual Light: By comparison with the provisions of Acceptable Solution G7/AS1
- ► H1 Energy Efficiency: By comparison with the provisions of Acceptable Solution H1/AS1

THERMAL PERFORMANCE AMBIANCE UPVC SUSTAINABLE ENGINEERING REPORT

14 November 2022

Starke Ambiance SELtd Accepted Joinery

Twenty-one frame profiles of Starke Ambiance frames have been modelled by Starke to determine Uf value and fRsi of the frames. Sustainable Engineering has reviewed these reports and collated the data for use in PHPP.

Boundary conditions are set per ISO 10077-2 in Flixo Frame software.

Table	1:	PHPP	Data
-------	----	------	------

Wind	Window frames								
		U _r -Value			Frame width				
ID	Description	left	right	bottom	above	left	right	bottom	above
		W/(m ² K)	W/(m ² K)	W/(m ^a K)	W/(m ² K)	m	m	m	m
01ud	Starke Ambiance Fixed White	1.30	1.30	1.30	1.30	0.070	0.070	0.070	0.070
02ud	Starke Ambiance Awning White	1.34	1.34	1.34	1.34	0.117	0.117	0.117	0.117
03ud	Starke Ambiance Tilt & Turn White	1.38	1.38	1.38	1.38	0.119	0.119	0.119	0.119
04ud	Starke Ambiance Hinge Door White	1.43	1.43	1.43	1.43	0.147	0.147	0.147	0.147
05ud	Starke Ambiance Sliding Door Fixed	1.37	1.62	1.34	1.34	0.056	0.055	0.056	0.056
06ud	Starke Ambiance Sliding Door Operable	1.62	1.52	1.52	1.56	0.055	0.145	0.145	0.145
07ud	Starke Ambiance Fixed Black	1.34	1.34	1.34	1.34	0.070	0.070	0.070	0.070
08ud	Starke Ambiance Awning Black	1.36	1.36	1.36	1.36	0.117	0.117	0.117	0.117
09ud	Stake Ambiance Tilt & Turn Black	1.47	1.47	1.47	1.47	0.119	0.119	0.119	0.119
10ud	Starke Ambiance Hinge Door Black	1.44	1.44	1.44	1.44	0.147	0.147	0.147	0.147

Note that the Sliding door operable head and jamb fails the PHPP9 fRSI criteria in warm and warm-temperate climates. We recommend discussing with your certifier and using the PHPP10 criteria.

Both Black and White options meet the fRSI criteria for PHPP9 in warm and warm-temperate climates.

AMBIANCE UPVC SUSTAINABLE ENGINEERING REPORT

Figure 1: This map shows the three different fRSI zones at the weather station altitudes. The climate zone and thus the fRSI requirements also vary with altitude as the average temperatures typically drop by 0.6C per 100m of elevation gain. In general these zones can be used without considering the elevation change. Illustration: Sustainable Engineering Ltd. fRSI requirements from <u>PHI</u> <u>Passive House Standard Building Criteria</u>.

GLASS SPACER

CERTIFICATE

Certified Passive House Component Component-ID 1547sp03 valid until 31st December 2022 Passive House Institute Dr.Wolfgang Feist 64283 Darmstadt Germany

GLASS SPACER

Technoform Glass Insulation GmbH Matthäus-Merian-Straße 6, 34253 Lohfelden, Germany ☎ | ⊠ | ≅ http://www.technoform.com |

Description

The SP12, SP13, SP14 is a polymeric/metal hybride spacer for rigid and tight thermally improved edgebonds of insulating glazing.

Spacer height:	6.90 mm
Thermal conductivity:	0.310 W/(m K) (WA 17/1, ift Rosenheim)
Available spacer widths:	8, 10, 12, 14, 15, 16, 18, 20, 22 and 24 mm

Appropriate secondary seal	Specific edge resistance R_E	Efficiency class
Polysulfide	3.40 m K/W	phB
Polyurethane	3.40 m K/W	phB
Silicone	3.60 m K/W	phB

Explanation

Spacers are categorized into different efficiency classes based on the resistance of their edges R_E . A secondary polysulfide sealant is typically used, unless the spacer is not approved for polysulfide. A detailed report with the calculations is available from either the manufacturer or the Passive House Institute.

The Passive House Institute has defined global component requirements for seven climate regions. In principle, components that have been certified for climates with higher requirements can also be used in climates with lower requirements. This may be economically advantageous.

Use in PHPP:

If individually calculated values are not available then the thermal bridge loss coefficient specified in this document can be used. In this case, the appropriate reference frame must be selected and a 10% safety margin should be applied.

Further information regarding certification is available on www.passivehouse.com and www.passipedia.org .

QUALITÄTSVERBAND KUNSTSTOFFERZEUGNISSE E.V. **EPPA General Information** QKE, GKFP, EPPA Plastic windows (1,23 m x 1,48 m) with double insulating glass unit Programme holder Owner of the declaration IBU - Institut Bauen und Umwelt e.V. QKE - Qualitätsverband Kunststofferzeugnisse e.V. Hegelplatz 1 Am Hofgarten 1-2; 53113 Bonn Germany 10117 Berlin GKFP - Gütegemeinschaft Kunststoff-Germany Fensterprofilsysteme e.V. Am Hofgarten 1-2; 53113 Bonn Germany EPPA - European PVC Profiles and related Building Products Association ivzw Avenue de Cortenbergh 71; 1000 Brussels Belgium **Declaration number** Declared product / declared unit EPD-QKE-20220002-IBG1-EN The declared unit consists of 1 m² of window surface area. The reference window is a single-sash tilt and turn window 1.23 m x 1.48 m in size with double insulating glass unit and PVC-U frame material with optional surface finishing (coated, covered with PVC foil or PMMA) and possibly additionally fitted with an aluminium covering shell. The planned replacement of individual components gasket, hardware and glazing during a 40-year service life have been included. This declaration is based on the product Scope: category rules: This declaration is an association EPD. Windows and doors, 01.2021 It covers all constructional forms for PVC windows which comply with the stated characteristics. These are (PCR checked and approved by the SVR) both conventionally blocked and bonded window designs and different profile reinforcement and surface Issue date design variants. 03.05.2022 Data from the production plants of the following system suppliers and window manufacturers was included: Valid to aluplast - Ettlingen (DE) 02.05.2027 Deceuninck - Bogen (DE), Calne (GB), Hooglede-Gits (BE), Jasin (PL), Roye (FR) GARGIULO - Nehren (DE) GEALAN - Bukarest (RO), Guopstos (LT), Rzgów (PL), Tanna (DE) hapa - Herrieden (DE) Internorm - Sarleinsbach (AT), Traun (AT) profine - Berlin (DE), Marmoutier (FR), Pirmasens (DÈ) REHAU - Srem (PL), Wittmund (DE) Salamander – Türkheim (DE), Wloclawek (PL) SCHÜCO – Weißenfels (DE) TMP - Bad Langensalza (DE) VEKA - Burgos (ES), Burnley (GB), Sendenhorst (DE), Skierniewice (PL), Thonon-les-Bains (FR) The weighted mean of the data from eleven member companies with 27 production sites in nine countries was used as a database for manufacturing the plastic profiles. The production quantity thus recorded corresponds to approximately 80% to the European production of the profile manufacturers who are organised in the EPPA, GKFP and QKE associations.

AMBIANCE UPVC EPD

	QUALITÄTSVERBAND KUNSTSTOFFERZEUGNISSE E.V. FOR LANGLEBGE KANSTSTOFFERDURFE

This association EPD can be used by the member companies of the three associations EPPA, GKFP and QKE as well as window manufacturers who use this company's plastic profile systems.

Man Peter

Dipl. Ing. Hans Peters (chairman of Institut Bauen und Umwelt e.V.)

Alank Hails

Dr. Alexander Röder (Managing Director Institut Bauen und Umwelt e.V.))

The owner of the declaration shall be liable for the underlying information and evidence; the IBU shall not be liable with respect to manufacturer information, life cycle assessment data and evidences.

The EPD was created according to the specifications of *EN 15804+A2*. In the following, the standard will be simplified as *EN 15804*.

Verification

The standard EN 15804 serves as the core PCR

AMBIANCE UPVC EPD

2. Product

2.1 Product description/Product definition

Single-sash window 1.23 m x 1.48 m with PVC-U frame profiles, double insulating glass unit and tilt-turn hardware.

Steel, aluminium or glass fibre extruded into the PVC material can be used as reinforcement in the PVC profiles.

The profile surface can be made with different finishes: Uncoated white, covered with PVC foil, covered with PMMA (polymethylmethacrylate), coated or fitted with a separate aluminium covering shell. This results in white or coloured, smooth or structured surfaces.

The gaskets consist of soft PVC, EPDM (ethylenepropylene-dien monomer) or TPE (thermoplastic elastomere); the hardware are mainly made of steel.

The average window for this EPD is the white steelreinforced basic variant. However, the inputs/outputs determined from the production quantities are included for profile production, whereby all surface finishing processes which are actually performed at the plants are included.

This EPD declares the average environmental quality for the PVC windows of the member companies of the EPPA, GKFP and QKE associations. Window manufacturers who use this company's plastic profile systems can also make use of the declaration. Detailed product data is available from the respective manufacturers' specific descriptions.

EU regulation no. 305/2011 (*CPR*) applies for putting the windows on the market in the EU/EFTA (with the exception of Switzerland). The product requires a declaration of performance including the harmonised product standard *DIN EN 14351-1:2016-12* Windows and doors – Product standard, performance characteristics – Part 1: Windows and external pedestrian doorsets and also CE labelling.

The respective national regulations apply to use.

2.2 Application

Windows are inserted into the outer building shell for lighting, ventilation and weather protection.

2.3 Technical Data

The figures and/or classes shown in the following table apply to the reference on which this EPD is based. Far higher classes are being achieved depending on the design of the frame, hardware, gaskets and insulating glass unit.

Name	Value	Unit
Possible opening types	tilt-turn	-
Glazing unit structure	4/16/4	mm
Total energy transmittance g	62	%
Heat transfer coefficient glass Ug in accordance with EN 674, EN 675	1.1	W/(m²K)
Heat transfer coefficient window Uw in	1.2	W/(m ² K)

accordance with EN 674, EN 675		
Air permeability in accordance with EN 12207	2–4	Class
Resistance to wind load in accordance with EN 12210	B1–C5	Class
Water tightness in accordance with EN 12206	4A–9A	Class
Mechanical stress (durability) in accordance with EN 12400	10000– 20000	Cycles

The construction details and the performance values in accordance with the declaration of performance apply to the specific window unit put on the market by the respective manufacturer with regard to their main characteristics in accordance with harmonised product standard *DIN EN 14351-1:2016-12*, Windows and doors – Product standard, performance characteristics – Part 1: Windows and external pedestrian doorsets.

2.4 Delivery status

This EPD relates to a reference window 1.23 m x 1.48 m in size.

2.5 Base materials/Ancillary materials

The main components of the reference window are:

Name	Value	Unit
25.87 kg insulating glass unit	45.2	mass %
16.79 kg frame material, PVC-U	29.3	mass %
11.87 kg reinforcement, steel	20.7	mass %
1.83 kg hardware, steel	3.2	mass %
0.76 kg gaskets, soft PVC, . EPDM, TPE	1.3	mass %
0.13 kg screws, steel	0.2	mass %
0.05 kg setting blocks, PP	0.1	mass %

The following representative generic composition for the individual formulae used by the profile manufacturers for the PVC frame is included for the EPD:

- 81.0 mass % PVC
- 8.1 mass % filler (chalk)
- 4.9 mass % impact resistance modifier
- 2.8 mass % calcium-zinc-stabilisers
- 3.2 mass % titanium oxide (TiO2) pigment

Can a partial product contain candidate materials from the *ECHA candidate list* of materials which are especially problematic for approval (as of 01/04/2020): (Substances of Very High Concern - (SVHC)) above a mass % of 0.1: Yes, the PVC profile. This may be the case if recycled PVC window material is used in the core of the product cross-section in the manufacture of this product. These profiles may contain lead compounds (CAS number 7439-92-1 of the ECHA candidate list as of 01/04/2020) at a mass of more than 0.1 %.

Does the product contain further Category 1A or 1 B CMR substances (carcinogenic, mutagenic or toxic to

QUALITÄTSVERBAND KUNSTSTOFFERZEUGNISSE E.V. EPPA

reproduction) which are not on the ECHA candidate /ist at above 0.1 mass %: No.

Have biocidal products been added to this building product or has it been treated with biocidal products: No.

2.6 Manufacture

Plastic windows are made of the following components: PVC frame profiles with gaskets and if necessary reinforcement, insulating glass unit and hardware.

Fig. 2-1: Schematic diagram of the manufacture of a window unit

The PVC profiles are produced in an extrusion process from a mixture of PVC powder and additives. The latter protect the PVC against damage during processing and give the profile the necessary characteristics such as impact resistance, colour and weather resistance.

The PVC powder for producing the frames is a widely available mass plastic and is manufactured by polymerisation. Due to its chemical structure, PVC contains a considerable proportion of the halogen chlorine.

Coloured surfaces can be produced by fitting an aluminium covering shell, applying a foil, coating or by co-extrusion with a PMMA layer. Gaskets are either attached to the window profile in a co-extrusion process during extrusion or rolled in subsequently.

The window profiles are supplied to window manufacturers in standard lengths. There they are sawn to the lengths required for respective windows. As far as necessary, steel reinforcement is pushed in and screwed in place. The profiles are then welded, the hardware attached and the glazing and glazing beads inserted.

The steel to produce the hardware is mainly manufactured from iron ore in a furnace process through reduction with coke.

The raw material basis for the manufacture of the glazing is formed by quartz sand and the addition of various fluxing and oxidation agents (soda ash, sodium sulphate, potassium carbonate, etc.). In a further

processing step, the melted raw glass is placed in a tin melt from which a flat glass ribbon is continuously drawn (float glass process).

Quality assurance

GKFP e.V. member companies are subject to external quality control as part of voluntary self-commitment. Those plastic window profile systems which may be labelled with *RAL-GZ 716* are listed on the association's website at gkfp.de/en: gkfp.de/en/product-overview/profile-systems-with-ral-quality-mark

Those window manufacturers which use the RAL quality mark in accordance with *RAL-GZ 695* are also subject to external monitoring. A list is available on the Gütegemeinschaft Fenster, Fassaden und Haustüren e.V. website (window.de/guetegemeinschaft-fenster) at: ral-fachbetriebe.fenster-können-mehr.de/

2.7 Environment and health during manufacturing

Individual measures at production plants such as the implementation of an environmental or energy management system in accordance with *ISO 14001* or *ISO 50001* are to be found in individual company profiles.

2.8 Product processing/Installation

The finished windows are transported to the construction site and built into the building structure. Galvanised steel screws are used for installation. The use of installation foam (polyurethane) is possible.

2.9 Packaging

Cardboard, polyethylene wrap and foam pads are used to transport the individual components to the window manufacturer. The frame profiles are generally transported in reusable steel cassettes and occasionally in disposal wooden pallets.

Reusable racks are normally used to deliver the windows together with foam pads and polyethylene stretch film, cardboard and polypropylene load-securing belts and aluminium or steel clamps.

If not reused, metal packaging material is recycled; other packaging is generally thermally recycled or otherwise disposed of in landfill.

Waste code according to the *European Waste Catalogue*:

- 15 01 01 Cardboard
- 15 01 02 Plastics
- 15 01 03 Solid wood and wood-based materials
- 15 01 04 Metals

EPPA

2.10 Condition of use

Plastic windows are very long-lasting and durable. Their material composition does not change during use.

2.11 Environment and health during use

The environment and health are not negatively affected by the PVC frame material. This also applies to the window element as long as the use of solventfree components is guaranteed downstream in the supply chain.

2.12 Reference service life

The service life for the product and its components is assumed as follows in accordance with *BBSR 2017*:

- 40 years for the plastic window
- 30 years for the insulating glass unit
- 30 years for the building hardware
- 20 years for the gaskets

One replacement of gaskets, hardware and glazing is included in the EPD since the service life for the components is less than that of the finished product.

2.13 Extraordinary effects

Fire

Depending on the design and surface finish, plastic windows can achieve classes E to B in accordance with *EN 13501-1* with regard to reaction to fire.

Name	Value
Building material class	E–B
Smoke production	s3
Flaming droplets	d0

Water

No effects which are detrimental to the environment occur in the event of unforeseen water exposure, such as flooding.

The watertightness of the window is influenced by the design implementation and durability of the frame profile, gasket and hardware. Different classes of water tightness are achieved accordingly (see 2.3).

Mechanical destruction

No negative effects for the environment occur on unforeseen mechanical destruction.

2.14 Re-use phase

Material recycling is easily possible and technically realised for all window components. The PVC frame

6

material is maintained in a controlled closed circuit and reused in window profiles after reprocessing. The steel used for hardware and reinforcements can also be recycled without any loss of quality. Material recycling is also easy for the glazing but usually associated with a loss in quality.

2.15 Disposal

The individual components of the plastic window can be incinerated as non-dangerous waste (without energy recovery) or disposed of in landfill.

Waste code according to the European Waste Catalogue:

- 17 02 02 Glass
- 17 02 03 Plastic
- 17 04 02 Aluminium
- 17 04 05 Iron and steel
- 2.16 Further information

Further information is available via the websites of the associations

www.eppa-profiles.eu www.gkfp.de/en www.gke-bonn.de

and also those of the system houses and window manufacturers.

3. LCA: Calculation rules

3.1 Declared Unit

The declared unit consists of 1 m² of window area on a reference window (similar to *EN 14351-1* and *EN 17213*). Its frame area ratio F_F in relation to the overall surface area is around 28%.

Declared unit

Name	Value	Unit
Declared unit	1	m ²
Declared unit mass	31.4	kg
Reference window: Width x height	1.23 x 1.48	m
Frame area ratio	27.8	%
Mass	57.3	kg
Conversion factor reference window up to 1 m²	0.5493	-
Conversion factor to 1kg	0.0318	-

The balanced production volume used for average calculation is based on the information from the companies named in 1 'Scope'. The underlying production process varies only slightly from one manufacturer to another. It is therefore assumed that the data is representative and robust.

3.2 System boundary

The complete lifecycle from cradle to grave is examined for the declared unit. The production stage (Modules A1–A3), the construction stage (A4, A5), the use stage (B1, B2), the disposal stage (C1–C4) and benefits and loads beyond the system boundary (D) are relevant but not the further modules of the use stage (B3, B4).

Manufacturing

The aggregated illustration in the form of A1–A3 is used for manufacturing. This includes the provision of raw materials and energy, the production of steel reinforcement, glazing, hardware and PVC profile, transport of the components to the window manufacturer, the energy consumption needed for this and accruing production waste. The consumption for heating the production plants and also the attached rooms is also specifically included. However, investment goods (machines, buildings, etc.) remain ignored.

Transport from the window manufacturer to the construction site is included in Module A4 and also the auxiliary and operating materials used for installation and the disposal of packaging waste in Module A5 in accordance with *EN 17213*.

Use phase

The transmission heat losses during the use phase are included in Module B1 and the replacement of window components mentioned in 2.12 in Module B2.

Disposal

7

All processes which relate to the removal, dismantling or demolition of the window out of the building and which are not to be regarded at building level are calculated into Module C1.

Redistribution transports from the construction site to waste treatment fall in Module C2. Waste management processes, especially energy recovery from waste, are included in Module C3. This also includes sorting for recycling.

Disposal and also thermal waste treatment are allocated to Module C4.

Credits

Finally, Module D shows the reuse, recovery and recycling potentials beyond the system boundary.

3.3 Estimates and assumptions

Average transport distances from background date will be assumed insofar as no specific information on transports is available. This especially concerns Module A2.

Dust and emissions accruing during production or disposal are examined by means of generic data.

With regard to replacing components during use and also the dismantling of the window it is assumed that the expenses are equivalent to those of installation.

3.4 Cut-off criteria

All known inputs and outputs are included in the lifecycle. Data gaps are filled with conservative assumptions and generic data. The input flows ignored are each below 1% of the total mass or the total flow of the primary energy. In total, they each represent less than 5% of the total mass or 5% of the total energy.

3.5 Background data

The modelling of the lifecycle is performed in the *GaBi* LCA software. The background data especially for the raw materials and the production of PVC, insulating glass unit and hardware originate from the *ecoinvent* 3.7 database. As specific, current and representative data as possible is used. The data used is not more than ten years old.

3.6 Data quality

Data from twelve companies with 28 production plants in nine countries are used as primary profile extrusion and window manufacturing data, see 1 'Scope'. This data collected for 2019 was checked for plausibility and consistency. Further average information originates from the associations. The quality of the

specific data is therefore to be regarded as extremely good.

At least 80% of all contributions to the core indicators of each impact category result from five background data records. Their representativeness is predominantly to be regarded as good to excellent. Data records with lower representativeness are only used in individual cases. The quality of the background data is therefore to be estimated as good overall.

3.7 Period under review

The primary data was collected for 2019.

Averages weighted with the production volume are used for production data for profile extrusion and window manufacture.

3.8 Allocation

No co-products accrue when producing the window and in further processes (Modules A1-A3). No coproduct allocation is therefore necessary in foreground processes. Co-products for which an allocation is present in background data records accrue in the prechain for PVC, for example when producing vinyl chloride.

Energies used, auxiliary and operating materials and also waste (Modules A1-A3) are each recorded at plant level and distributed to the products across the produced mass.

Recyclates deployed (Modules A1-A3) are included in terms of a closed loop so that no allocation takes place.

In Module D, benefits and loads result from recycling PVC and metals as well as energy recovery from waste.

3.9 Comparability

Basically, a comparison or an evaluation of EPD data is only possible if all the data sets to be compared were created according to *EN 15804* and the building context, respectively the product-specific characteristics of performance, are taken into account.

This LCA was compiled with the *ecoinvent* 3.7 database.

4. LCA: Scenarios and additional technical information

Characteristic product properties Information on biogenic Carbon

The total mass of biogenic carbon materials is less than 5 % of the total mass of the product and the associated packaging.

Basic information

The downstream technical information is the basis for the declared modules or can be used for the development of specific scenarios in the context of a building assessment if modules are not declared (MND).

Statements mainly relate to one declared unit.

Transport to the construction site (A4)

Name		Value	Unit	
Specific fuel consum	0 122	l/(t*km)		
tonne kilometre	7.5 t truck	0.152	I/(t"KM)	
	40 t truck	0.023	l/(t*km)	
Transport distance	7.5 t truck	9	km	
	40 t truck	69	km	

Installation into the building (A5)

The auxiliary and operating materials (e.g. fixing materials, sealants) are included in the window's LCA in accordance with EN 17213 but not the energy consumption during installation which is to be regarded at building level in the EPD, which is why this data is for information only.

Name	Value	Unit
Polyurethane installation foam	0.180	kg
Screws	0.077	kg
Electricity consumption	0.085	kWh

Use phase (B1)

The net heat losses caused by the window are included here. These consist of the transmission heat losses and the solar gains. Since these depend very strongly on actual climatic condition at the place of installation and the technical circumstances of individual building, the environmental effects stated in this EPD are merely to be regarded as examples.

The following conditions are assumed: The calculations for heat losses and gains and the results of the impact assessment are based on parameters of average European conditions. The energy demand during the use phase at the reference location is calculated in accordance with DIN V 18599-2. The following applies:

Name	Value	Unit
EU degree day factor	2135	K*d
Solar radiation	155	kWh/m²a

The provision of heat energy is modelled as follows with German energy needs:

- 49 % Gas
- 25 % Heating oil 14 % District heating
- 12 % Other (e.g. biomass, electricity).

Maintenance (B2)

The service life for the window is calculated as 40 years in accordance with BBSR 2017. The replacement of individual components after reaching the end of their technical useful life (see 2.12) is included in B2 in accordance with EN 17213:

Name	Value	Unit
Replacement cycle : Glazing	1	Number/ RSL
Gaskets	1	Number/
Clashets		RSL
Hardware	4	Number/
Hardware	1	RSL
Electricity consumption	0.085	kWh
Polyurethane installation foam	0.180	kg
Screws	0.077	kg

End-of-life (C1-C4)

The recycling quotas and disposal routes are countryspecific and deviate strongly from one another in the European area. The LCA is based on the following assumptions:

Name	Value	Unit
Collection quota across all	95	%
materials	95	70
* thereof to recycling	-	
Glass	65	%
PVC	59	%
Steel/aluminium	92	%
Other	0	%
* incineration quota of the material		
to be disposed of	-	
Glass	25	%
PVC	35	%
Steel/alumnium	0	%
Other	20	%
Transport distance	22	km
Dismantling electricity consumption	0.085	kWh

Reuse, recovery and recycling potential (D), relevant scenario information

The energy resulting from thermal and material recycling (thermal energy and electricity) and the recycling material accruing are credited in this module as follows:

10.10 kg net flow secondary glass 4.03 kg net flow secondary PVC

- 2.50 kg net flow secondary Steel 3.69 MJ exported electrical energy
- 8.15 MJ exported thermal energy

Environmental Product Declaration EPPA ivzw, GKFP e.V., QKE e.V. - Plastic window with double insulating gass unit

T EPPA		RAL	QUALITÄTSVERBAND KUNSTSTOFFERZEUGNISSE E.V. FOR LANGLEIGE KUNSTSTOFFPRODUKT	K
Telasper tub Acostan	FENSTERPROFILSYSTEME	Suple Conflort	EUR LANGE FRIGE KUNSTSTOFFRODUKTE	

5. LCA: Results

The net heat losses caused by the window are included for B1 use phase. The LCA results shown here are for information only as the losses depend very strongly on actual climatic conditions at the installation location and the technical circumstances of individual buildings.

Important

EP fresh water: This indicator was implemented in co-ordination with the characterisation module (EUTREND model, Strujis et al., 2009b, as in ReCiPe; http://eplca.jrc.ec.europa.eu/LCDN/developerEF.xhtml) calculated as "kg P-Eq".

Disclaimer 1 – applies to the indicator IR "Potential Human exposure efficiency relative to U235"

This impact category mainly deals with the possible impact of low-dose ionizing radiation on human health in the nuclear fuel cycle. It does not consider neither impacts due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. The potential ionizing radiation emanating from the soil, from radon and from some construction materials is also not measured by this indicator.

Disclaimer 2 – applies to the indicators ADPE, ADPF, WDP, ETP-fw, HTP-c, HTP-nc, SQP "abiotic depletion potential for non-fossil resources", "abiotic depletion potential for fossil resources", "water (user) deprivation potential, deprivation-weighted water consumption", "potential comparative toxic unit for ecosystems", "potential comparative toxic unit for humans – cancerogenic", "Potential comparative toxic unit for humans - not cancerogenic", "potential soil quality index".

The results of this environmental impact indicator shall be used with care as the uncertainties with these results are high or because there is limited experienced with the indicator.

Environmental Product Declaration EPPA ivzw, GKFP e.V., QKE e.V. – Plastic window with double insulating gass unit

6. LCA: Interpretation

6.1 Summary

Many of the environmental impact and resource use indicators are dominated by the manufacturing phase (Modules A1–A3). In addition, the energy consumption needed to compensate heat losses through the window (Module B1), maintenance (Module B2) and to a lesser extent waste treatment (Module C3) take a major share of the indicators.

The impacts within the system boundary can be compensated by recovery and recycling potentials beyond the system boundary (Module D).

Within Modules A1–A3 the insulating glass unit, the metal components and the PVC dryblend contribute to the results to a similar extent.

Sensitivity observations show that different window designs (e.g. with regard to reinforcement material or also in relation to the dimensions) and also the surface design influence the environmental impacts of the manufacturing phase at least within the range up to $\pm 10\%$.

The largest contribution in Module B2 originates from the replacement of the glazing.

The declaration of Module B1 is optional for windows. However, since these have a significant influence on the energy household of a building it makes sense to assess their use phase. The values declared for B1 apply to the exemplary application case specified in Section 4 and are for information only. Optimisation would involve reducing transmission heat losses determined by the heat transfer coefficients and to optimise the solar gains (e.g. through alignment and shadows).

6.2 Sensitivity to the use of PVC recyclate

The impacts described above caused by the PVC frame material used change with the PVC recyclate ratio. The environmental impacts decrease in Modules A1–A3 if fresh PVC material is replaced by recyclate. In case of a share of 40% the effects here decrease by 6% on average (range -3% to -25%).

Furthermore, an increase in the proportion of recyclate in the profile results in assessment differences in Module C3 (PENRM indicator) and also smaller benefits in Module D due to the reduced quantity of PVC recyclate which crosses the system boundary. This drops on average by 24% with a 40% share of recyclate (range -51% to +9%).

Fig. 6-1 shows how greatly the total GKWP indicator in Module A1–A3 is reduced by an increase in recyclate content. The recyclate content determined for 2019 was approximately 21%.

The use of PVC recyclate in the profile is, however, limited. On the one hand because unlimited amounts of recycling material are not available and on the other due to the profile design, where design or qualityrelated requirements can make the use of fresh material necessary.

A maximum of 40% PVC recyclate in relation to the annual tonnage of profile production appears technically realisable under these framework conditions. Individual profiles can contain a significantly higher proportion of recyclate in spite of this.

6.3 Isolated view of the impact indicators and their influencing factors

6.3.1 Environmental impacts

Proportion of environmental impact indicators

Fig. 6-2: Indicators to describe the environmental impacts, distribution per module

Environmental Product Declaration EPPA ivzw, GKFP e.V., QKE e.V. – Plastic window with double insulating gass unit

EPPA

Global warming potential (GWP)

Greenhouse gas emissions are above all attributable to production, energy consumption in the use phase and maintenance. The most relevant greenhouse gases are carbon dioxide (fossil 83%, biogenic 9%) and methane (fossil 8%, biogenic 1%). The effects of land use changes are extremely low.

Depletion potential of the stratospheric ozone layer (ODP)

Impacts on ozone depletion mainly result from the production phase and energy consumption in the use phase. Emissions of halon 1301, halon 1211 and tetrachloromethane are mainly responsible for this.

Acidification potential of land and water (AP)

Acidification potential results above all from emissions of nitrogen oxides and sulphur oxides which occur during the production phase, maintenance and the use phase.

Eutrophication potential (EP)

The impacts on the eutrophication of water and soil originates above all from the production phase, maintenance and energy consumption in the use phase. The relevant emissions are phosphates and nitrogen oxides.

Formation potential for tropospheric ozone photochemical oxidants (POCD)

Ozone formation close to the ground is above all attributable to the production, maintenance and use phases. The relevant emissions are nitrogen oxides and volatile organic compounds without methane (NMVOC).

Abiotic depletion potential for non-fossil resources (ADPE)

The consumption of non-fossil resources results above all from production, maintenance and also use to a lesser extent. Consumption can be partly compensated beyond the system boundary (substitution of primary material). The elements which make the greatest contribution are tellurium, lead, silver, gold, zinc and copper.

Abiotic depletion potential for fossil resources (ADPF)

Fossil resources are consumed above all through the use of energy in production, use and maintenance. This concerns above all natural gas, oil and coal energy carriers.

Use of water (WDP)

Use of water results above all from energy production with hydro-electric power for production, maintenance and use. Water is, however, actually consumed in the provision of the raw materials - glass, steel and PVC.

6.3.2 Use of ressources

Fig. 6-3: Indicatores to describe the unse of ressources

Renewable primary energy as energy carrier (PERE) and for material use (PERM)

Renewable primary energy is used above all energetically in the production, maintenance and use phases. This is mainly biomass and hydro-electric and wind power. Material use, on the other hand, plays a smaller role; effects result from the stabiliser used.

Non-renewable primary energy as energy carrier (PENRE) and for material use (PENRM)

Non-renewable primary energy is also mainly used as energy; consumption of gas, oil and coal in the use, production and maintenance phases is relevant here. Material use in new PVC is of less significance.

Use of secondary materials (SM)

Secondary materials are used for the provision of metal components, especially steel, and also PVC and glass. Secondary materials in Module D are also provided for use beyond the system boundary.

Secondary fuels (RSF, NRSF)

The results are only partly significant due to methodical limitations. Secondary fuels are not used within the processes and data included.

Use of net fresh water (FW)

Use of water is used above all for energy production with hydro-electric power for production, maintenance and use. The consumption of fresh water results above all from the production of raw materials - glass, steel and PVC.

C EPPA

QUALITĀTSVERBAND

6.3.3 Output flows and waste categories

Fig. 6-4: Waste categories and output flows

Hazardous waste disposal (HWD)

The results are only partly significant due to methodical limitations. Small quantities of hazardous waste are deposited in PVC production and its pre-chains.

Non-hazardous waste disposal (NHWD)

The results are only partly significant due to methodical limitations. Non-hazardous waste accrues above all from waste disposal (Module C4) and maintenance. This is mainly deposited glass waste. On the other hand, the contribution from PVC production is extremely small.

Radioactive waste disposal (RWD)

The results are only partly significant due to methodical limitations. Contributions result from electricity shares from nuclear energy including in PVC production.

Components for reuse(CRU) Nothing accrues.

Materials for recycling (MFR)

Materials for recycling are provided above all by waste treatment (Module C3), maintenance and to a lesser extent by recycling production waste. This is glass, metal and PVC.

Materials for energy recovery (MER) Nothing accrues.

Exported energy (EEE, EET)

Energy in the form of electricity (EEE) and heat (EET) is recovered especially from waste treatment and exported, and here above all by incinerating PVC waste.

6.3.4 Additional impact categories

Fig. 6-5: Additional impact categories in accordance with EN 15804+A2

The distribution of further indicators to be stated optionally in individual modules of the lifecycle in accordance with EN 15804+A2 can be seen in Fig. 6-5. There is no discussion.

CULLITATSVERBAND Neuroscience N

7. Requisite evidence

7.1 Fire behaviour

Fire tests in accordance with *EN 13823* on several samples from various manufacturers by Efectis Nederland BV, project number 2012-Efectis-R0205

Results:

In accordance with the average parameters determined, plastic windows fulfil the classification criteria in accordance with *DIN EN 13501-1*: 2007+A1:2009 as follows:

Fire behaviour class: B-E

Smoke production: s3 Flaming droplets: d0

7.2 VOC emissions

7.2.1

Final Report VOC Emission Study 'Plastic Windows'

Institut für Holztechnologie Dresden gemeinnützige GmbH (IHD). NO 1516009. July 2017

The results of several examinations of indoor pollution with VOC emissions are summarised in the report.

Results:

With regard to the French *Décret* n° 2011-321 VOC ordinance for building products, all window elements examined fulfilled the best possible class A+ according to *Arrêté etiquetage* 2011.

With regard to the *AgBB* German assessment schema, all PVC frame profile variants examined (white, coated, foil-covered) fulfil the requirements.

7.2.2

Research project on VOC emissions in building components

The Federal Office for Building and Regional Planning (BBR) as part of the research initiative on the future of building (Bundesamt für Bauwesen und Raumordnung im Rahmen der Forschungsinitiative Zukunft Bau), file ref. Z6-10.08.18.7-08.20/II2-F20-08-005; December 2010

Results: With regard to indoor pollution, the requirements of the assessment by the *AgBB* schema are undercut.

Span Charts 14x341 Mullion

- Spans are the maximum calculated allowable, based on the revised NZS 4211, which requires that the member deflection at serviceability wind press (SWP) should not exceed 1/200 of the span.
- All spans have been calculated to indicate performance in each wind zone. Current NZS 4211 compliance should be checked against the latest aluplast reports and size limits imposed by NZS 4211, Section 5.2.2, should not be exceeded.
- Any custom calculations can be performed as required on request.

- This sheet is only applicable if the profile combination is continuous from head to sill and not applicable if fixed light above or below.
- Spans are the maximum calculated allowable, based on the revised NZS 4211, which requires that the member deflection at serviceability wind press (SWP) should not exceed 1/200 of the span.
- All spans have been calculated to indicate performance in each wind zone. Current NZS 4211 compliance should be checked against the latest aluplast reports and size limits imposed by NZS 4211, Section 5.2.2, should not be exceeded.

2x 14x328 Door Sash with 14x366 Mullion

- Spans are the maximum calculated allowable, based on the revised NZS 4211, which requires that the member deflection at serviceability wind press (SWP) should not exceed 1/200 of the span.
- All spans have been calculated to indicate performance in each wind zone. Current NZS 4211 compliance should be checked against the latest aluplast reports and size limits imposed by NZS 4211, Section 5.2.2, should not be exceeded.
- Any custom calculations can be performed as required on request.

CARE & MAINTENANCE

Cleaning

STARKE AMBIANCE window profiles are made of a weather resistant and easy-to-care synthetic material of stable value. To clean the even, non-porous and hygienic surface, normal soapy water can be used. Soiling due to dust and rain can be removed easily by this means. Do not use abrasives or chemicals as nitro diluents, benzene or similar agents for cleaning. In case of soiling that cannot be removed as described above, please consult your window specialist.

Initial Cleaning

Despite all the care taken by the craftsmen during installation, soiling like residues of mortar, wallpaper paste, adhesives etc. may occur. Residues of mortar and colour splatters can be removed with a semi-rigid putty knife by carefully scraping off the soiling. After that, wipe with a damp cloth. Please be careful not to scratch the surfaces with the small but sharp pebbles in the mortar. Residual adhesives on the glass surface can be removed carefully with an inclined razor blade.

Maintenance

In order to ensure proper functioning of the hardware for your new STARKE AMBIANCE window and doors for years to come, the following maintenance works should be done at least once a year:

- Check all hardware elements with security-related function frequently for wear.
- Lubricate all movable parts with a drop of oil and the locking points of the hardware elements with acid-free grease or industrial Vaseline.
- Use only cleansing agents and care products that do not affect the hardware's corrosion protection.

Ventilation & Condensation

Condensation should not occur on your new STARKE AMBIANCE windows or doors. If condensation occurs, this is a sign that the humidity in your room is too high. Windows present such a high air impermeability and are sealed so tightly to the building structure that no natural air change can take place. By proper ventilation and with modern windows you can save heating costs and create a healthy room climate at the same time. Cross ventilation through two opposite windows is especially quick and effective – one single open window sometimes is not enough. Keeping the window open for 5 minutes is sufficient to change the indoor air. For a more thorough airing of the rooms, open the windows wide for 10 minutes. To facilitate the air change, Basic Air plus[®] or REGEL-air[®] ventilation systems can be installed in the window.

For this reason we recommend:

- Ventilate three to four times a day.
- Remove items that obstruct the air flow: leave an air gap between furniture and the wall; curtains should not cover the heater but reach only to the window sill.
- Keep doors to less heated rooms closed.
- Ventilate more frequently in case of additional humidity due to cooking, bathing, taking a shower etc.
- In the winter season, open your windows wide several times a day for a short time instead of keeping them tilted for hours.
- Always let humid air escape to the outside never to other rooms.
- Fogged-up windows are a clear signal that ventilation is needed.
- Heating and frequent ventilation are the prerequisites for a healthy room climate.

Starke Group Ltd warrants that, for a period of ten years from the date of supply:

- (a) NZS 4211:2008 Performance of Windows, and NZS 4223:2016 Code of Practice for Glazing in Buildings
- (b) As required under NZS 4211 the product or products specified will remain watertight.
- (c) Installation of joinery is covered the installer.

If the Product does not perform as warranted, Starke Group Ltd will make good the Product, subject to the following terms:

- (a) that the details on this coupon are filled out and returned to Starke Group Ltd within 90 days;
- (b) that Starke Group Ltd is advised of and given an opportunity to inspect any fault;
- (c) that any claims under this warranty need to be made in writing to Starke Group Ltd within 7 days of the fault first becoming apparent;
- (d) that this warranty is not transferable and only applies to the original purchaser, unless Starke Group Ltd agrees otherwise;
- (e) that this warranty only applies:
- (a) that Starke Group Ltd will not be liable for any consequential,indirect or special damage or loss including, without limitation, any loss of profits;
- (b) that the warranty does not apply to any fault caused by incorrect installation by anyone other than Starke Group Ltd or its authorised agents. Correct installation details are available on request.
 - (i) where the Product has been maintained in accordance with the maintenance procedure specified in this "Care and Maintenance" booklet;

- (ii) to a defect in the workmanship or a defect that is directly attributable to a defect in the material of the Product; and
- (iii) where the purchaser has paid in full for the supply (and installation if applicable) of the window joinery;
- (f) that the warranty does not apply to any:
 - glass or glazing materials used in the joinery; glass breakage and surface defects except premature IGU failure as determined by Starke Group Ltd.
 - (ii) defects due to any cause beyond Starke Group Ltd.'s control including, without limitation, defects in the structure to which the joinery has been affixed;
 - (iii) materials, hardware or componentry or any joinery not manufactured by Starke Group Ltd;
 - (iv) This warranty does not apply to used or second-hand joinery
 - (v) weather tightness where the contract is one of manufacture and supply only, the junction between joinery and cladding systems is the responsibility or the builder;
 - (a) that Starke Group Ltd will not be liable for any consequential, indirect or special damage or loss including, without limitation, any loss of profits;
 - (b) that the warranty does not apply to any fault caused by incorrect installation by anyone other than Starke Group Ltd or its authorised agents. Correct installation details are available on request.

Please note: This warranty is subject to correct installation as outlined in our Installation Details Manual. This document is available on request for you or your builder.

Looking after our planet is the only option

It's reassuring to know that our windows contribute to creating a brighter tomorrow for future generations.

Not only do we use recyclable materials wherever possible, the best bit is our high-performance windows outperform traditional windows by 48%^{*} helping to reduce energy consumption. STÄRKE is ISO 14064-1:2018 environmentally certified with a goal of being carbon neutral by 2025.
